

Conclusions — turning findings into decisions someone owns

1 / 3

Step 6 of the weekly workflow: the analysis is only finished when a person knows what to do differently on Monday

The rewrite — same data, two very different conclusions

The left column is what an analyst reports. The right column is what a business can act on. The difference is not the analysis — it is who has to do the thinking.

Retention Reported as "D7 retention decreased by 4.1 percentage points week over week." Written to be used iOS players from the July creative set drop after their first bonus expires: ~1.2 pts of the fall, worth roughly €18k a month. Suggest re-testing the offer for this cohort. Owner: CRM.	Acquisition Reported as "CAC increased 22% in paid search." Written to be used Two campaigns absorbed 60% of the increase and pay back beyond 120 days. Pausing them frees ~€9k a week with no volume loss elsewhere. Owner: Performance marketing.	Affiliates Reported as "Partner B sends the most registrations." Written to be used Partner B is first on volume and last on FTD rate; on deposits per registration it is a third of Partner D. Suggest shifting budget and reviewing the CPA terms. Owner: Affiliate manager.	Product Reported as "Session length is down 8%." Written to be used The drop is confined to one game provider after their release on Tuesday. Not a player-behaviour change. Suggest raising it with the provider. Owner: Product.	Risk / RG Reported as "Deposit anomalies detected in 0.4% of accounts." Written to be used 37 accounts show a deposit pattern that matches previous bonus-abuse clusters, plus 6 accounts with RG-relevant escalation. Escalated as a list, not as a percentage. Owner: Risk.
---	---	--	--	---

A finding that does not change what anybody does next week is a fact, not a conclusion.

Data Analytics in iGaming by 2026

How conclusions are written, and what undermines them

The rules that keep a weekly summary short, honest and actionable — and the habits that quietly destroy trust in it

Rules for the weekly summary

- **Three to five findings, never twenty**
A list long enough to feel thorough is short enough to be ignored. Everything else goes into an appendix nobody is obliged to read.
- **Answer before evidence**
The conclusion comes first, the supporting numbers after. Stakeholders read the first two lines; the rest is for whoever wants to challenge it.
- **Impact in money or players**
Percentages hide scale. A finding is ranked by what it is worth, so attention goes where the value is.
- **Every recommendation has an owner**
Named person, specific action, realistic timeframe. Without an owner, a recommendation is a wish.
- **Confidence stated plainly**
Strong evidence, plausible hypothesis, or too early to tell — labelled, so nobody bets a budget on a signal I called weak.
- **Separate observation from interpretation**
What the data shows and what I think it means are written as two different things, so disagreement lands in the right place.
- **No surprises in a meeting**
Anything sensitive — a partner underperforming, a campaign wasting budget — is shared with the owner before it appears on a slide.
- **Written for someone with no SQL**
Marketing, finance and product read the same summary. Jargon that needs translating is jargon that gets skipped.
- **One line on what did not move**
Guardrail metrics that stayed stable are stated too, so nobody optimises the headline number at a hidden cost.
- **The finding nobody asked for**
Each summary carries at least one item outside the original request, because that is usually where the value is.
- **Sized against effort, not just value**
A €6k finding that takes a day beats a €20k one that needs a quarter — both are stated with the effort involved.

What destroys trust in the numbers

- **Overstating certainty**
One confident wrong call costs more credibility than ten honest 'not yet clear' ones.
- **Burying bad news**
A result nobody wants surfaces eventually; if it surfaced elsewhere first, the reporting is finished.
- **Recommending beyond the evidence**
'Rebuild onboarding' from a single week of data is an opinion wearing a dashboard.
- **Silent definition changes**
Improving a metric by redefining it is the fastest way to make every historical comparison worthless.
- **Reporting only what was asked**
The most valuable finding is usually the one nobody requested — leaving it out to stay on scope is a false economy.
- **Repeating last week verbatim**
If nothing changed, that itself is the finding, stated in one line rather than padded into a full report.
- **Presenting precision that isn't there**
Quoting a number to two decimals on data with a known tracking gap signals accuracy that the source cannot support.

Closing the loop — the part most reporting skips

- Every recommendation tracked to done / not done / dropped, with the reason.
- Where it was acted on, the effect measured against the expected impact I stated.
- Where the effect did not appear, that is reported too — including when my call was wrong.
- Recurring findings escalated: the third time the same issue appears, it is a process problem, not a weekly note.
- The follow-up list opens the next weekly summary, before any new finding.

Example — the weekly summary dashboard this step produces

Illustrative sample data, not real operator figures. The point is the structure: answer, evidence, action, owner

3 / 3

Findings & recommended actions

Finding	Why	Action	Owner	Impact
D7 retention -1.2 pts, iOS July-creative cohort	Players drop when the welcome bonus expires on day 6.	Re-test offer length for this cohort	CRM	≈ €18k / month
Two paid-search campaigns pay back beyond 120 days	They absorbed 60% of the CAC increase.	Pause and reallocate the budget	Performance	≈ €9k / week
Partner B: first on volume, last on FTD rate	A third of Partner D on deposits per registration.	Review CPA terms before renewal	Affiliates	≈ €6k / month
Session length -8% traced to one provider release	Not a player-behaviour change.	Raise with the provider	Product	monitor
37 accounts match a known bonus-abuse pattern	Shared device and payment instrument clusters.	Escalated as a named list	Risk / RG	≈ €4k saved

Follow-up on last week's recommendations

- Welcome-offer test (CRM)

Done — +0.8 pts D7 on the treated cohort
- Display budget cut (Performance)

Done — no volume loss, €7k saved
- Partner B renegotiation (Affiliates)

Not started — carried to next week
